Testing stateful, concurrent, and async systems using test.check

Eric Normand

PurelyFunctional.tv

Outline

- Example-based testing is inadequate
- Generating test data
- Generating sequential tests
- Adding parallelism

A stateful example

- A key-value database
  - Operations:

```
(db/create)

(db/clear!  db)
(db/store!  db k v)
(db/delete! db k)
(db/fetch   db k)
(db/size    db)
```

For the video and transcript of this presentation, click here:

https://lispcast.com/testing-stateful-and-concurrent-systems-using-test-check/

Let's test it!

DB should contain a key/value after storing

```
(deftest store-contains
)
```

DB should contain a key/value after storing

```
(deftest store-contains
  (let [db (db/create)
k “a”
v “b”]
                                    ))
```

DB should contain a key/value after storing

```
(deftest store-contains
  (let [db (db/create)
        k “a”
        v “b”]
    (db/store! db k v)
                                  ))
```

DB should contain a key/value after storing

```
(deftest store-contains
  (let [db (db/create)
        k “a”
        v “b”]
(db/store! db k v)
        (db/fetch db k)  ))
```

DB should contain a key/value after storing

```
(deftest store-contains
  (let [db (db/create)
        k “a”
        v “b”]
    (db/store! db k v)
    (is (= v (db/fetch db k)))))
```

store! should overwrite old values

```
(deftest store-overwrite
```

)

store! should overwrite old values

```
(deftest store-overwrite
  (let [db (db/create)
        k  “a”
        v1  “b”
        v2  “c”]
                                        ))
```

store! should overwrite old values

```
(deftest store-overwrite
  (let [db (db/create)
        k “a”
        v1 “b”
        v2 “c”]
    (db/store! db k v1)
    (db/store! db k v2)
                                  ))
```

store! should overwrite old values

```
(deftest store-overwrite
  (let [db (db/create)
        k “a”
        v1 “b”
        v2 “c”]
(db/store! db k v1)
(db/store! db k v2)
          (db/fetch db k)  ))
```

store! should overwrite old values

```
(deftest store-overwrite
  (let [db (db/create)
        k “a”
        v1 “b”
        v2 “c”]
(db/store! db k v1)
(db/store! db k v2)
(is (= v2 (db/fetch db k)))))
```

DB should be empty after clearing

```
(deftest clear-empty
```

```
)
```

DB should be empty after clearing

```
(deftest clear-empty
  (let [db (db/create)
k “a”
v “b”]
                                    ))
```

DB should be empty after clearing

```
(deftest clear-empty
  (let [db (db/create)
        k “a”
        v “b”]
    (db/store! db k v)
    (db/clear! db)
                                ))
```

DB should be empty after clearing

```
(deftest clear-empty
  (let [db (db/create)
        k “a”
        v “b”]
    (db/store! db k v)
    (db/clear! db)
               (db/size db)  ))
```

DB should be empty after clearing

```
(deftest clear-empty
  (let [db (db/create)
        k “a”
        v “b”]
    (db/store! db k v)
    (db/clear! db)
    (is (zero? (db/size db)))))
```

I don't want you to feel bad, but . . .

you should feel bad about these tests.

Not *guilty*, but scared.

How big is our system?

- How many strings are there?
- How many unicode characters are there?
- How many key-value pairs are there?
- How many operations are there?
- How many pairs of operations are there?
- How many triples of operations are there?

The *description* of the database is small.

Let's set up some generators

```
(def gen-key   gen/string)
(def gen-value gen/string)
```

```
> (gen/sample gen-key 20)

("" "Ï" "Û" "Ù" "þ7Ä" "Ì" "§" "þ8zÈäè" "" "Õ" "¢
öU÷¸" "W\b^è÷¯Ð\\" "\ngz|µþÒW." "ño" "ô>,
ß¡wA,\r!" ";ÊÑ²ãÔ9" "þèIà0TzJÜ\bi" "ó¥è¬#À&ö\\\"
ÈjF#" "u=?" "´ö")
```

Some easy properties...

DB should contain a key/value after storing

```
(defspec store-contains 100
```

```
)
```

DB should contain a key/value after storing

```
(defspec store-contains 100
  (prop/for-all [k gen-key
                 v gen-value]

                ))
```

DB should contain a key/value after storing

```
(defspec store-contains 100
  (prop/for-all [k gen-key
                 v gen-value]
(let [db (db/create)]

                          )))
```

DB should contain a key/value after storing

```
(defspec store-contains 100
  (prop/for-all [k gen-key
                 v gen-value]
(let [db (db/create)]
  (db/store! db k v)
                        )))
```

DB should contain a key/value after storing

```
(defspec store-contains 100
  (prop/for-all [k gen-key
                 v gen-value]
(let [db (db/create)]
  (db/store! db k v)
  (= v (db/fetch db k)))))
```

store! should overwrite old values

```
(defspec store-overwrite 100
```

)

store! should overwrite old values

```
(defspec store-overwrite 100
  (prop/for-all [k  gen-key
                 v1 gen-value
                 v2 gen-value]

                                ))
```

store! should overwrite old values

```
(defspec store-overwrite 100
  (prop/for-all [k  gen-key
                 v1 gen-value
                 v2 gen-value]
(let [db (db/create)]

                                 )))
```

store! should overwrite old values

```
(defspec store-overwrite 100
  (prop/for-all [k  gen-key
                 v1 gen-value
                 v2 gen-value]
(let [db (db/create)]
  (db/store! db k v1)
  (db/store! db k v2)
                          )))
```

store! should overwrite old values

```
(defspec store-overwrite 100
  (prop/for-all [k  gen-key
                 v1 gen-value
                 v2 gen-value]
(let [db (db/create)]
  (db/store! db k v1)
  (db/store! db k v2)
                          )))
```

store! should overwrite old values

```
(defspec store-overwrite 100
  (prop/for-all [k  gen-key
                 v1 gen-value
                 v2 gen-value]
(let [db (db/create)]
  (db/store! db k v1)
  (db/store! db k v2)
  (= v2 (db/fetch db k)))))
```

DB should be empty after clearing

```
(defspec clear-empty 100
  (prop/for-all [k gen-key
                 v gen-value]
(let [db (db/create)]
  (db/store! db k v)
  (db/clear! db)
  (zero? (db/size db)))))
```

```
{:result false,
 :test-var “store-contains",
 :failing-size 28,
 :num-tests 29,
:fail ["æ]qÜ\"Ì¹±W¿þZ¢Ëµgä>Å¨" “õZãºí®"],
:shrunk {:total-nodes-visited 139,
         :depth 33,
         :result false,
         :smallest ["æ" ""]},
:seed 1489522410083}
```

Can we describe the behavior in one go?

1. Build a simple, pure model

- A key-value database is like a *hash map*.

2. Reify the operations and make generators

```
(def gen-clear  (gen/return [:clear!]))
(def gen-size   (gen/return [:size]))
(def gen-store  (gen/tuple (gen/return :store!)
                           gen-key
                           gen-value))
(def gen-delete (gen/tuple (gen/return :delete!)
                           gen-key))
(def gen-fetch  (gen/tuple (gen/return :fetch)
                           gen-key))

(def gen-ops (gen/vector
              (gen/one-of [gen-clear  gen-store
                           gen-delete gen-fetch
                           gen-size])))
```

```
> (gen/sample gen-ops)

([]
 [[:clear!]]
 []
 [[:fetch "wº"] [:clear!]]
 [[:clear!] [:fetch "*QZü"] [:clear!] [:fetch “¤'"]]
 [[:size] [:size] [:delete! “K]¨j"]]
 []
 [[:fetch “t"]]
 [[:fetch "§6"] [:size] [:size] [:clear!]]
 [[:fetch "P/7¹"] [:store! "Þ=" ""] [:delete! "Â"]
  [:store! "B" "¬Ê'y"]])
```

3. Make 2 "runners"

```
(defn db-run [db ops]
```

)

3. Make 2 "runners"

```
(defn db-run [db ops]
  (doseq [[op k v] ops]
```

))

3. Make 2 "runners"

```
(defn db-run [db ops]
  (doseq [[op k v] ops]
    (case op
```

```
)))
```

3. Make 2 "runners"

```
